

- Go to <https://teachablemachine.withgoogle.com/train/image>. Images can be uploaded in classes, and trained.
- After training, go to the 2nd tab->keras->download
- The downloaded zip contains the model.

Export your model to use it in projects.

Converting model...

Converting your model in the cloud. This may take a few minutes.

Code snippets to use your model:

Keras
OpenCV Keras
Contribute on Github

```

from keras.models import load_model # TensorFlow is required for Keras to work
from PIL import Image, ImageOps # Install pillow instead of PIL
import numpy as np

# Disable scientific notation for clarity
np.set_printoptions(suppress=True)

# Load the model
model = load_model("keras_Model.h5", compile=False)

# Load the labels
class_names = open("labels.txt", "r").readlines()

# Create the array of the right shape to feed into the keras model
# The 'length' or number of images you can put into the array is
# determined by the first position in the shape tuple, in this case 1
data = np.ndarray(shape=(1, 224, 224, 3), dtype=np.float32)

```

Copy

- Now phase 2: log generation
 - Clone the repo <https://github.com/BhavikDodda/vid2log> by the command: `git clone https://github.com/BhavikDodda/vid2log`
 - Place the model in the new_model folder
 - Follow the prerequisites and installation process mentioned in README. [OCR step is optional]
 - Generate the log by running vid2log/center method/vid2log copy 3 after setting the right variables `model`, `class\_names` according to the model downloaded earlier.
